

Questions to answer:

- Mean speed of all of the rides
 - $\text{Speed} = \text{distance} * \text{time}$
- Number of rides taken in february
- Number of rides where tip more than \$50
- Number of rides where drop off was jfk airport
 - The dropoff code is 2 for jfk

Using `.shape[0]` is necessary to get the number of elements directly. If you used `.shape`, you would get a tuple, which might not be convenient for printing or further calculations when you only need the number of elements.
